- It neglects energy losses due to friction and turbulence
- It assumes steady flow conditions

In practice, engineers incorporate correction factors and head loss terms to account for these limitations.

Head Losses and Their Significance in Fluid Systems

Major Head Losses

Major head losses are primarily due to friction between the fluid and pipe walls, quantified by the Darcy-Weisbach equation:

$$h_f = \frac{f L v^2}{2 g D}$$

]

Where:

- (h_f) = head loss due to friction
- (f) = Darcy friction factor
- (L) = length of pipe
- (D) = diameter of pipe
- (v) = velocity of fluid

Understanding the factors affecting head loss:

- Pipe roughness
- Flow velocity
- Pipe diameter

Minor Head Losses

Minor losses occur at fittings, valves, bends, and expansions. They are expressed as:

]

$$h_m = K \frac{v^2}{2g}$$

\]

Where (K) is the loss coefficient specific to each fitting.

Importance in System Design

Accurately estimating head losses is critical for:

- Ensuring sufficient pump capacity
- Optimizing piping layouts
- Reducing operational costs

Venturi Meter

A Venturi meter has a converging section, throat, and diverging section, measuring flow based on pressure difference.
